

**FIELD SITUATION ASSESSMENT OF 2006
WET SEASON AGRICULTURAL
PRODUCTION IN NIGERIA**

**Report of a study conducted by NAERLS
and PCU**

October 2006

PREFACE

Field Situation Assessment of Wet Season Agricultural Production in Nigeria is an annual evaluation exercise, which this year was jointly conducted in September 2006 by National Agricultural Extension and Research Liaison Services (NAERLS) and Projects Coordinating Unit (PCU). Nine teams of three specialists per team covered all the 36 states of Nigeria and the Federal Capital Territory (FCT). However some useful secondary data were not obtained from some of the states.

We wish to extend our sincere appreciation to officials of those State Agricultural Development Projects (ADPs) and Ministries of Agriculture who made all the necessary arrangements to facilitate the study and also provided the required data. The results of the evaluation exercise have been put together into a national report, which is being circulated to all states and relevant Federal agencies. The problems of unavailability and inaccuracy of data still persist because many ADPs still do not keep livestock data. We hope that this situation will change soon. We look forward to receiving your comments on this report as they will enhance better reportage and facilitate our work in future.

EXECUTIVE SUMMARY

A national survey of the performance of the 2006 cropping season was conducted by a team of researchers from the National Agricultural Extension and Research Liaison Services, Ahmadu Bello University, Zaria and the Projects Coordinating Unit, Federal Department of Agriculture, Abuja in September 2006. A combination of structured questionnaire and rapid rural appraisal techniques were employed. The results of the study indicate that:

1. Rainfall was erratic in most of the Northern states at the beginning of the cropping season and that affected crops like sorghum, millet and groundnut. By May to June, rainfall had established and full scale farming activities commenced. In terms of quantity and distribution the rains were considered good for cropping activities throughout the nation.
2. The cropping patterns remained the same as that of previous years. Mixed and strip cropping with cereal and legumes were the common practices across the country. In addition, it was observed in most of the states that there were new openings of land in support of various government interventions to promote certain crops such as rice, maize and cassava.
3. Except for dry spell experienced in some states like Kebbi, Kano, Gombe, Borno and Katsina at the beginning of the season that led to multiple planting, the crop production this year was favourable.
4. Incidences of insect pest and diseases outbreak were not severe where they occurred.
5. The area devoted to sorghum increased by 2.5% while the output increased by 4.91% over the previous year. Maize hectareage increased by 4.8% while the output increased by 8.42% over that of 2005. Similarly rice increased in hectareage by 5.76% while the output also increased by 14.44% over that of 2005. There was an increase of 5.18% in the land devoted to millet and output of 7.01% over that of 2005. Groundnut production increased in hectareage by 1.91% and output by 4.46% over that of 2005. Total land devoted to cowpea increased by 4.19% while the output increased by 3.61% over that of 2005. The total land area devoted to cassava increased by 17.21% while the output was 25.4% higher than that of previous year. However, there was a decrease in the land area devoted to yam by 2.16% but this did not affect the output which increased by 9.8% compared with 2005 output, which, is an indication that the weather was favourable for yam production in 2006.
6. Livestock production situation in the country showed slight increase in 2006 over 2005. However, most states lacked credible records. The problem of diseases and pest attack still persist in most states on large ruminants, poultry and swine, thus causing substantial economic losses. Livestock input procurement and distribution were not a priority of most states.

7. Records of fisheries production situation, incidences of pests and diseases and input procurement and distribution are not kept by most states. This has been the trend over the years.
8. There were generally marginal increases in cost of production of the major agricultural commodities with the exceptions in Zamfara, Nasarawa, Yobe and Adamawa states where cost of production substantially increased by 40 – 80.7%. However, despite the increases, marginal or no reduction on production cost was observed for some commodities in few states.
9. Many states did not operate tractor hiring services and where available were not sufficient. Animal traction where practiced helped to reduce the cost of land preparation. The high cost of investment in owning a tractor as well as cost of tractor hiring services for tillage operation constitute serious problem for farmers. Grain storage facilities are in poor shape in many states of federation.
10. Generally the prices of commodities declined in August 2006 as compared with the same period in 2005 with the exception of cowpea for which the price was fairly stable but varied in parts of North west and North East.
11. The ADPs and/or state government input supply companies were involved in procurement and distribution of improved farming inputs. Government subsidy on fertilizer was maintained during the season. Fertilizers were readily available in the open market but the prices were prohibitive. There were reports of poor quality of fertilizer in some states. High cost and adulterated agro-chemicals were also reported.
12. As in previous years the ADP, were unable to carryout most of their activities satisfactorily due to inadequate and untimely disbursement of funds

Based on the results of the exercise the following recommendations were made:

1. There is need for accurate data collection and hence there is need for appropriate data collection mechanism at the Agricultural Development Project. This specially refers to rainfall data collection and, if need be, rainfall data should be confirmed at the nearest metrological stations based at airports.
2. The Federal, States and LGAs should have a working arrangement to increase the number of tractors to better the deplorable tractor hiring situation in some of the states. This will make tractor hiring available to farmers at affordable rate. In the alternative, government should encourage the formation of viable farmers groups who will have the purchasing power to own tractors at subsidized rates.
3. The states, federal and state government should set up control and standardizing unit for fertilizers and other agro-chemical under the Ministry of Agriculture or ADPs. This will check the issue of sub-standard and adulterated chemicals.

4. The available government storage facilities across the states should be renovated to mop up excess produce expected this year. This will prevent glut and at the same time enhance price stability to the advantage of the farmers, which will in turn encourage farmers to stay in farming business
5. The agency responsible for extension in the state which is the ADP should be at the centre of fertilizer distribution in the states.
6. Funds should be made available and timely for ADPs to carryout their extension actions. ADPs should also exploit the possibilities of executing joint agricultural extension activities with LGAs for the benefit of the farmers.
7. As a long term solution to the funding of agricultural extension, the three tiers of government should contribute a certain amount of funds for the extension purpose.

1.0 INTRODUCTION

The 2006 annual wet season evaluation survey was conducted between 3rd and 20th October, 2006. The objectives of the exercise were:

- i. to evaluate the performance of crops and livestock during the wet season;
- ii. to identify conditions affecting effective technology transfer within the season;
- iii. to identify constraints to agricultural production; and
- iv. to provide feedback on field situation and farmers' problems to research institutions and policy makers.

Questionnaire survey, Participatory Rural Appraisal (PRA) and interviews were employed in data collection. All the 36 states and Federal Capital Territory were covered by 9 teams of 3 researchers per team (Appendix 1). Although the teams visited all the ADPs, not all the ADPs provided the required data. In each state/FCT, farmers from two ADP zones were interviewed using group approach. Extensive discussions were held with officials of state Ministries of Agriculture, ADPs and staff of Input Supply Companies. Field trips were conducted by the teams and in most States, wrap-up meetings were organized on the last day of the exercise. Crop production data for 2005 are figures from the ADPs' Crop, Area and Yield Survey (CAYs) obtained from PCU. The 2006 figures are forecasts by the teams based on the observed situations in the fields and interviews held with farmers. Livestock production data as in previous years were difficult to come by.

2.0 RAINFALL SITUATION

The rainfall situation in Nigeria in 2006 followed the normal pattern with variations according to the country's agro-ecological zones. The commencement of rains in the North west and North eastern zones was early in most states of the zones. By April 2006, 7 States out of 36 did not witness any rain. The States are: Jigawa, Kebbi, Sokoto, Zamfara, Borno, Yobe and Gombe. By May the rains had established in all the states of the federation, though there were reports of long dry spell that lasted from 2 to 7 weeks in most of the states in the North east, North west and some States in the Central zone of the country. The dry spell had severe adverse effect on early crops including: millet, maize and cowpea. There was no report of flood in the North east and North west. However some states in the central zone namely: Niger, FCT and Benue reported minor flooding along the flood plains near the banks of rivers and streams. This had minor damage on crops like yam, maize and rice. The rainfall situation in the south west and south eastern zone of the country was excellent with the commencement of the rains from January in most states except Osun, Ogun, Bayelsa and Enugu. Table 1 provides the details of rainfall situation across the zones and the states. The general assessment of the rainfall situation was that apart from the dry spell experienced in some northern states, the distribution of the rains in 2006 was even.

2.1 North West Zone:-

The rains commenced in April in three of the states in the zone, it arrived late in Kebbi, Sokoto, Zamfara, Jigawa and Northern part of Katsina states. By May the

rains were fully established with intermittent dry spells in May up to July. The dry spell affected most of the early millet, cowpea and water melons adversely. The total amount and mean rainfall received at the end of August this year was higher than that of last year in most states in the zone except Jigawa, Kano and Zamfara states. Generally the visual field situation assessment of the zone indicated that millet would yield lower in 2006 compared to 2005 but other late crops would do well.

2.2 **North Central Zone**

Rains started early in this zone as it commenced in Jan/Feb early, but became well established in April. There had been a little dry spell in Niger, Plateau, Kogi and Nasarawa states. On the other hand there were reports of flood in FCT, parts of Niger and Benue States, which affected crops near the flood plains. Both the flood and dry spell that were experienced caused minor damages to crops. The general assessment of the situation this year was that the total amount of the rains received was more than that of last year, in all the states of the zone.

2.3 **South East Zone**

The rain commenced in January in most of the states but it became established in March. There was no report of dry spell in the zone. Generally the rainfall distribution can be said to be even. However, three states in the zone namely, Akwa Ibom, Anambra, and Delta were unable to provide the rainfall data in their respective states. In most of the states in the zone the amount of rainfall received was more than that of last year. This had led to the case of flooding in some states like Enugu, Rivers and Bayelsa. This had adverse effects on yam, cassava and vegetable fields.

2.4 **South west zone**

The rains commenced early with first rains in January in all the states in the zone except Ogun. The rains established in February/March but there was a dry spell in Ogun, Osun and Oyo states. The total amount of rainfall received was more than that of last year. The rainfall distribution was even in most states except Ogun and Osun. Farmers in the zone were expecting good harvest for their crops this year.

3.0 CROPPING PATTERNS AND CROP PERFORMANCE

The information on the cropping patterns in 2006 cropping season is contained in Table 2. There were no major shifts in crop mixtures reported in all the states visited. The South-East and South-West zones maintained their traditional yam

and cassava based inter cropping while the Northern zones continued the practice of cereal-legume based mixtures. The major crop mixtures in the north-west, north-east and north-central zones were: Maize/ sorghum/ cowpea, millet/ soyabean/ cowpea, sorghum/ millet/ groundnut, maize/

groundnut, millet/ groundnut and maize/ millet/ sorghum, while the major crops mixtures in south-west and south-east zones were yam/cassava/maize, cassava/maize, yam/maize and yam/cassava.. There was an increase in rice based mixture in the northern zones. Prominent in this increase were rice/maize and rice/sorghum in the north west and north east zones.

It appears from the observations made across the country that rice and maize based mixtures are gaining more popularity than sorghum based mixtures. This may possibly be due to various interventions on both crops. The presidential initiative on increased rice production and “doubling maize” project may have contributed to the renewed interest in the cultivation of both rice and maize. There were variations among the states regarding plant arrangement, in the mixtures. It is not uncommon to see in some cases of more than six crops in mixtures, some within the rows while others are in alternative rows for cereal based cropping system.

In the north-west and north-east zones, planting cereal and legume in 2:1, 2:2 and 4:3 rows were not common. In the south-east and south west where heaps or mounds were used, it was not uncommon to find in the same farm an intercrop of

cowpea, cassava, okro, vegetable and maize. It was apparent that most of these multiple mixtures were at subsistence level to meet varying needs of the farmers, who sell out the excess.

Table 2: Major/Common Crop Mixtures Observed in 2006

3.1 Sorghum

Sorghum is mostly grown in the northern states of the country with Borno States as the highest producer having the estimated area of 767,430 ha and output of 883,140mt, in 2006. Total area devoted to sorghum throughout the country increased in 2006 over 2005 by 2.59% and the total output also increased by 4.91%. Other states with high production include Kaduna, Kano, Katsina, Niger and Zamfara states. In each of these state, the area devoted to sorghum is above 300,000 ha in 2006. The output was also reported to increase in 2006 in all the producing states. This could be attributed to the availability of improved seeds and less incidence of pest and disease.

3.2 Maize

Maize is one of the crops produced in all the states of the federation. After

sorghum, maize is the second among the cereals in terms of area cultivated in the country in both 2005 and 2006 with an increase of 4.89% over 2005. Despite the lower area cultivated compared to sorghum, maize was estimated to have the highest output across the country with a total of 5,484,860mt in 2006, an increase of 8.42% over 2005. The higher output compared to the other cereals is

obvious because maize is a high - yielding crop among them.

3.3 Rice

Rice is cultivated in almost all the states of the federation and FCT. Notable producers are Benue, Ebonyi, Niger and Taraba states with the area cultivated in 2006 and 2005 as 166,400ha and 150,000ha respectively. The total cultivated area in the country in 2006 (1,386,490ha) was higher than that of 2005 (1,310,970ha). The output was also higher in 2006 than 2005 with the estimated values as 2,591,410mt and 2,965,660mt for 2005 and 2006 respectively (Table 4a). The production was adversely affected in some parts of the country especially the southern states by inadequate availability of fertilizers and processing equipments.

3.4 Millet

Millet is cultivated only in the northern states of Nigeria. Sokoto state was the highest producer with the area cultivated being 747,580ha in 2006 as against 598,050ha in 2005, recording an increase of 25.0% in 2006. The

corresponding output in Sokoto was estimated to be 642,910mt in 2006 which was 25.0% higher than that of 2005. Total area cultivated in 2006 for all the producing states was estimated as 3,963,320ha, which is 5.81% higher than the area cultivated in 2005 (Table 3a).

3.5 Groundnut

Groundnut is produced mostly in the northern part of the country, with few states of the south as producers. Kano state is the highest producer

where 418,040ha was cultivated this year which is the same as the area estimated last year (2005). Other notable producers are Benue, Borno, Kaduna, Katsina, Niger, Taraba and Zamfara states. Total land cultivated throughout the country increased in 2006 over

2005 by 1.91%. Total output in 2006 (2,792,470mt) was higher than the output in 2005 (2,712,360mt) which was an increase of 2.95%.

3.6 Cowpea

The production of cowpea is mainly done in the northern part of the country which is in the savanna ecological zone. Some few states in the southern part of the country also produce cowpea but in small quantities. The highest land area devoted to cowpea was recorded in Borno state (637,590ha) in 2006, followed by Zamfara state (400,000ha). Other states with substantial land area devoted to cowpea include Bauchi, Gombe, Jigawa, Kaduna, Kano, Katsina, Niger and Yobe. The total area devoted to cowpea in the country this year was (2,801,020ha) which is 4.19 more than that of 2005 (2,688,440ha). Total output in 2006 (1,634,240mt) also increased by 3.61% over that of 2005 (1,577,280mt).

3.7 Soyabeans

Soyabeans production takes place mainly in the northern part of the country. Both

area cultivated and the output were reported to be low compared to cowpea. This could be attributed to the higher demand for cowpea than soyabeans. Among the producing states, Benue reported the largest land area cultivated (167,250ha) in 2006, which is the same as that of 2005. Kaduna state is the second after Benue in terms of both area cultivated and output with estimates of 108,990ha and 76,760mt respectively. Total land area devoted to soyabean in 2006 (322,380ha) decreased by 3.76% over that of 2005 (334,960ha). Despite the decrease in land area in 2006, the total output increased by 1.71%.

3.8 Melon

Melon is more popularly grown in the southern states of the country. Some states of the Middle belt were reported to cultivate melon with Niger state being the highest producer, followed by Benue in both 2005 and 2006. The total area cultivated in 2006 was (523,670ha), which recorded an increase of 3.03% over that of 2005. The 2005 and 2006 output were estimated to be the same in most of the states, despite the increase in land area. This was attributed to insect pest incidence. Total output estimated for the country in 2006 was 196,730mt, which is 6.26% higher than that of 2005 recorded as 185,140mt.

3.9 Cotton

Cotton production was reported to be carried out by very few (8) states of the country. All the producing states fall into the northern part of the country, Zamfara states is the highest producer with 94,640ha land area devoted to the crop followed by Katsina which cultivated 89,830ha in 2006. Total land area devoted to cotton in the country increased by 2.52% in 2006 over the previous year. Generally, output was estimated to increase, in all the producing states in 2006 except Sokoto state where a reduction of 20.06% as estimated. The estimate for 2006 output in the country (320,480mt) was said to be more than 2005 output (313,710mt) by 2.12%. Farmers drastically reduced the production of cotton compared to the previous years. This is due to the instability of cotton market in the country.

3.10 Yam

Yam is produced in almost all the states of the country with the exception of some states in the north namely Bauchi, Borno, Gombe, Jigawa, Kano, Katsina, Sokoto and Yobe. Yam did well in most states due to the fact that rainfall establishment and distribution favoured its growth and development in 2006. Benue state was reported to be the highest producer in 2006 with cultivated land area of 228,400ha followed by Niger (212,380ha), Taraba (212,230ha), Enugu (209,540ha) and Kaduna (1,808,550ha). Total land area devoted to yam in 2006 (1,824,700ha), decreased by 2.16% compared to that of 2005 (1,864,900ha). Despite the decrease in land area, the output in 2006 (25,160,190mt) was estimated

to increase by 9.80% over that of 2005 (22,913,980mt), which is an indication that the weather was favorable for yam production in 2006.

3.11 Cassava

Cassava is one of the most popular crops grown in almost all the states of the country. This popularity gained momentum when the cassava

initiative programme of the Federal government was launched. Southern states are the leading producers compared to the northern states in terms of both area cultivated and output. Total land area devoted to cassava in 2006 was estimated to be 2,468,990ha, which is 17.21% higher than that of 2005 (2,106,450ha). Cassava

output across the country was estimated to be 33,460,380mt recording an increase of 25.00% over that of 2005 which was given as 26,682,460mt.

3.12 Other root crops

Among the other root crops sweet potato and cocoyam appear to be the most popular and produced in almost all the states of the federation.

Sweet potato is largely produced in Benue, Kaduna and Niger states.

The total land area devoted to its production in 2006 was estimated to be 191,620ha which is 5.08% higher than the area cultivated in 2005 (182,360ha). The estimated output

also increased in 2006 (1,294,150mt) by 0.55% over that of 2005 (1,287,130mt). Cocoyam is also

highly produced in Abia, Ekiti, Enugu and Niger states. Total land area

cultivated in the year 2006 (312,810ha) is 10.32% higher and that of 2005 which was estimated as 283,420ha. Cocoyam output across

the country was estimated to be 2,181,370mt in 2006 which is 8.51% above the output estimated in 2005 given as 2,010,380mt.

3.13 Tree Crops

Tree crops are grown in almost all the states of the federation with variations depending on the ecological zones and climatic conditions. The most popular tree crops grown across the country include mango, citrus, oil palm, cocoa, rubber, cashew and kola. Tree crops were observed to look healthy this year, which is attributed to adequate, and well distributed rainfall experienced during the season. Higher output is expected this year (2006) compared to last year (2005).

3.14 INCIDENCE OF PEST ON CROPS

There was no major pest outbreak during the year under review. The minor pest incidence recorded in the year included grasshopper which was widespread across the country specifically in Rivers, Cross rivers, Osun, Balyesa, Kano, FCT, Kebbi, Ondo, Ekiti, Gombe, Adamawa, Borno, Oyo, Enugu and Akwa Ibom states. Other pests of national significance during the year were stem borers, Aphid, Ouelea birds, Village Weaver birds, Termites, Rodents/grasscutter, Army worm, Mealy bug, Blister beetle and leaf miner (Table 5a).

Stem borer was reported on, millet, sorghum, rice and maize in Yobe, Adamawa, Nasarawa, Bauchi and Kaduna states and on maize and rice in Osun and Balyesa states. Zamfara, Kebbi, Borno, Katsina and Kano states reported the incidence of

aphid on cotton, pepper and cowpea while Cross River and Lagos states reported aphid on pepper.

Moderate incidences of termite were reported on maize, Cassava, yam, sugar cane, and plantain in Osun, Ekiti, Kano (on sugar cane), Cross river and Rivers states. Similarly, Yobe, Gombe, Borno, Kebbi, Ogun, Kwara and Cross river

states witnessed moderate incidence of Quelea and village Weaver birds in the year. There were also moderate incidence of Striga on maize, rice, millet and sorghum in Yobe, Sokoto, Jigawa, Kano, Kaduna, Borno, Benue, Niger, Nasarawa, Bauchi and Katsina states. Moderate incidence of Army Worm were recorded on vegetables, sorghum and millet in Katsina, Lagos and Nasarawa states. Mealybug incidence was reported on mango, citrus, and cassava in Yobe, Abia, Taraba, Ebonyi, Osun, Kwara, Nasarawa, Benue, Kaduna and Abia states. Moderate incidences of blister beetle were also recorded on millet, sorghum, vegetables and cowpea in Yobe, Abia, Taraba, Ebonyi, Osun, Kwara, Nasarawa, Benue, Kaduna and Abia states, while leaf miner incidences were recorded on Teleferia, cassava and citrus in Abia, Kwara and Jigawa states. Generally, all the pest incidences were moderate. Grasshopper incidence occurred on more crops and in more states than the other pests in the season. Striga incidence still prevails mainly in the northern and central zones (Table 5a). The control measures employed included cultural indigenous knowledge system (IKS) and chemicals.

3.15: INCIDENCE OF DISEASES ON CROPS

There were incidences of light to heavy diseases attack on crops during the season across the nation. Light incidence of cassava blight and leaf curl were reported in Kwara state, leaf curl disease on cassava also in Ondo state. Light Bacterial blight and leaf spot were also reported on crop seedlings (sorghum, cowpea, maize, cotton), citrus, guava, cashew and mango in FCT, Taraba, Kebbi, Zamfara, Kaduna and Kwara states (Table 5b).

There was a report of heavy infestation of gummosis on mango and citrus in Oyo, Nasarawa, Adamawa and Enugu states. Other reported moderate disease incidences were black pod of cocoa in Abia, Ondo, Ekiti and Osun states, rice blast in Gombe, Kebbi, Bauchi and Kano States; black sigatoka on banana and plantain in Rivers, Delta and Lagos states. Cassava mosaic disease was also reported on cassava in Cross river, FCT, Rivers and Abia States. Moderate incidence of bacterial wilt also reported on tomato and pepper in Lagos, Oyo, Benue, Taraba and Ogun States.

Anthracnose diseases was reported only in Yam in Enugu state. The control measures used in ameliorating these diseases included cultural, chemical, indigenous knowledge system (IKS) and the use of resistant/improved varieties of crops (Table 5b)

Table 5a: Incidences of Pest on Crops

Pest	Crop Infected	State Where Reported	*Severity Rating	Reported Control Measures Adopted
Grasshopper	Rice, millet, maize, Groundnut, Yam, Vegetables, Coffee	Rivers, Cross Rivers, Osun, Balyesa, Kano, FCT, Kebbi, Ondo, Ekiti, Gombe, Adamawa, Borno, Oyo, Enugu, Akwa Ibom	2	Chemical;
Stem borer	Millet, Sorghum, Rice, Maize	Yobe, Adamawa, Osun, Balyesa, Kaduna, Nasarawa, Bauchi	2	Chemical Cultural
Aphid	Cotton, cowpea, pepper	Zamfara, Kebbi, Borno, Cross Rivers, Balyesa, Katsina, Kano, Lagos	2	Chemical
Termite	Maize, cassava, Yam, Sugarcan, Plantain	Osun, Ekiti, Kano, Cross River, Rivers	2	Chemical
Ovelea/weaver bird	Millet, Rice, Sorghum	Yobe, Gombe, Borno, Kebbi, Ogun, Kwara, Cross Rivers, Sokoto	2	Scaring

Table 5b: Incidences of Diseases on Crops

Pest	Crop Infected	State Where Reported	Severity Rating	Reported Control Measures Adopted
Black pod	Cocoa	Abia, Ondo, Ekiti, Osun	2	Chemical
Nematode	Plantain, Banana, Tomato, Cassava	Rivers, Ogun, Cross Rivers, Oyo Delta	2	- Chemical - Cultural
Cassava Blight	Cassava	Kwara,	1	Chemical
Blast	Rice,	Gombe, Kebbi, Bauchi, Kano	2	Chemical
Black sigataka	Banana, Plantain	Rivers, Delta, Lagos	2	- Cultural - Resistant variation
Mosaic	Cassava	Cross Rivers, FCT, Rivers, Abia	2	- Cultural - Improved varieties
Leaf curl	Cassava	Ondo, Kwara	1	Nil
Bacterial blight	Crop seedlings, Sorghum, Cowpea, Maize, Cotton	FCT, Taraba, Kebbi, Zamfara	1	- Improved/Resistant varieties - Cultural - Chemical
Bacterial wiit	Tomato, pepper	Lagos, Oyo, Benue, Taraba, Ogun	2	Chemical
Gumosis	Mango, citrus	Oyo, Nasarawa, Adamawa, Enugu	3	Cultural
Leaf sport	Citrus, Guava, Cashew, Mango	Kaduna, Kwara	1	Cultural Iks (use of Engine oil)
Anthravnose	Yam	Enugu	3	Nil

***Severity Rating**

1 = Light

2 = Moderate, 3= Heavy

4.0 USE OF IMPROVED FARM INPUTS IN CROP PRODUCTION

4.1 Seeds/planting materials

The availability of planting materials through government sources is shown in Table 6. Agricultural Development Projects and state government input supply companies were involved in the procurement and distribution of improved seeds. Generally, seeds for cereal crops were the most widely distributed, while very few states distributed seeds for legume crops. Planting materials for root and tuber crops were available in the South-Eastern and South-South States. Many of the states reported that though the prices for planting materials were affordable, the quantities available were inadequate. Discussions with farmers indicated that though there was increased awareness on the use of improved seeds by farmers, many of them were unable to access improved seeds/planting materials due to non availability and high costs.

4.2 Use of Agrochemicals

Table 7 gives the availability of agrochemicals and associated equipment through the various state owned agencies. The Table indicates that there were very limited quantities of agrochemicals at affordable prices. Discussions with farmers revealed low use of agrochemicals was due to high costs, non-availability and adulteration.

4.3 Fertilizer procurement and distribution

Fertilizer procurement and distribution through government agencies is shown in Table 8. The Table indicates that NPK, Urea and SSP were the main fertilizer types procured and distributed. Prices were variable across states and fertilizer types. Unit prices of NPK ranged from ₦1000.00 in Kano state to ₦2, 450.00 in Delta state, while the unit price of Urea ranged from ₦1000.00 in Kano state to ₦2, 930 in Delta state. However, the unit price of SSP ranged from ₦1350.00 in Taraba state to ₦2, 000.00 in Sokoto state. Prices of fertilizer sourced from the open market were higher and ranged from ₦1, 800.00 to ₦3, 200 for NPK type. Distribution mechanisms for fertilizer differed across states. In some states, fertilizer distribution was centrally done from the state ministry of agriculture, while some other states involved the use of agro service centres and local governments. Most of the fertilizers required for crop production were not available at reasonable distances in most rural areas and many urban centres. Information from farmers showed that fertilizers were inadequate and were not supplied in a timely manner. There were also reports of poor quality fertilizers in some states. Many states still had stocks of fertilizer left at the time of the study, suggesting the need for improvement in the distribution mechanisms adopted by states.

Table 6: Use of improved planting materials

5.0 LIVESTOCK AND FISHERIES PRODUCTION SITUATION

5.1 LIVESTOCK PRODUCTION AND PRODUCTIVITY

The problem of accurate and reliable data on livestock population still exist in most states. The major complaint by the ADPs was that no state agency was responsible for regular and systematic collection of data on livestock. Data available from 25 states were based on working estimates. The North Eastern zone had the highest concentration of cattle (15.9million) with highest number in

Taraba followed by the North West (7.7m) and the Middle Belt (6.9m) (Table 9). The North East and North West zones had 17.5 million and 12.9 million herd of sheep respectively.

Distribution of Goats from the estimates shows that the North East, North West and South West had high

population of 18.2 million, 12.2 million and 11.8 million respectively, while the South East reported the lowest (1.4 million). High population of local fowls was recorded in the Middle Belt (58.9million) and North West (48.4 million), while the South West had the highest population of improved fowls (10.5 million). Other livestock reared across the zones were guinea fowl, duck, turkey and pigeons. Records on Quail production were only available in North West, Middle Belt and South Western zone.

5.2 Pest and Diseases of Livestock

Table 10 shows the recorded incidence of pest and diseases in livestock across the states. The prevailing pest/disease problems of ruminants were PPR (cattarrh) in sheep and goat with moderate severity in 13 states, light incidence in two states and heavy incidence in Sokoto, Borno and Akwa-Ibom States. CBPP was reported in cattle herds mainly in North West and North East, while helminthiasis, foot and mouth disease (FMD) and scabies were reported on cattle, sheep and goat across the states. Notable pest/diseases of poultry birds were avian influenza (bird flu) in Kano, Katsina, Taraba, Plateau, FCT, Ogun, Lagos and Enugu States with heavy mortality to flocks. Other poultry diseases were New castle disease, dysentery, fowl pox, gomboro, ecto parasites and coccidiosis in some states. There were also reports of light to moderate occurrences of bloat in goats (Enugu), rabbies

in dogs (Kebbi), trypanosomiasis in cattle (FCT and Nassarawa), mange in goats (Ekiti, Lagos, Imo and Akwa-Ibom) and African swine fever in Benue, Ogun, Delta, Lagos and Akwa-Ibom with different levels of severity.

However, major problems in handling livestock pests and diseases are:-

1. High cost of drugs and vaccines
2. Lack of cold chain storage for vaccines due to erratic power supply, thus rendering them ineffective
3. Lack of technical know-how on use of recommended dosage of drugs by most farmers
4. Shortage of veterinary personnel resulting in patronage of quacks by farmers with detrimental effects
5. The traditional free range system promotes incidence of pest and diseases in livestock.
6. Poor information network (feed back) on disease occurrence and outbreak
7. Lack of diagnostic tools for identification of diseases by extension and animal health workers preventing quick intervention.

5.3 **Livestock Input Procurement and Use**

The problem of livestock inputs record in terms of quantities procured and used still exist in most states. Infact the few states that have input agencies handle mainly crop based inputs. Only 5 states had scanty records (mostly estimates) of the livestock input situation (Table 11).

While all the inputs were indicated to be affordable by livestock farmers anti-biotic, vaccines, salt licks and cotton seed cakes were inadequate to meet farmers' needs. Most of the drugs and feed ingredients were sourced from the open market, private stores, and companies. From the survey, the major problems with inputs usage in livestock subsector are:-

1. Scarcity of most drugs and vaccines
2. Dominance of expired drugs and vaccines in the open market. These are detrimental to livestock.
3. Lack of established agencies in most states to handle agricultural inputs procurement and distribution.

5.4 **Fish Production Situation**

Table 12a shows fish production situation in some states. In the Southeast, there is generally an increased production in aquaculture and capture fisheries in Oyo, Lagos and Ekiti State in 2006 against the 2005 production estimates. The same trend was observed in the South East with Anambra and Abia. In Bayelsa however, both

aquaculture and capture fisheries had downward production in 2006 when compared to 2005. In the North West, Kebbi recorded a similar downward production trend. In the North East, Yobe, Borno and Gombe had improved production generally in 2006. Jigawa however, had decreased aquaculture

production. Kogi, Kwara and Benue in the Middle Belt recorded increased production in 2006 against 2005.

5.5 **Pest and Diseases in Fisheries**

The major diseases experienced in fisheries across the states (Table 12b) were mainly fungal, bacterial, nutritional and to some extent viral (abdominal portrusim) with high, moderate or heavy severity reported across the states in the culture of Tilapia and Clarias. Notable pests of culture fishes reported during the survey were dragon fly nypnms, predatory amphibians and birds. Broken skull cases in Clarias were reported in Anambra and Borno States.

The major problems in handling pest/diseases situation in fisheries are:

1. Lack of expertise in fish disease identification and treatment by most fisheries personnel and extension workers.
2. Inadequate veterinary personnel with fish disease-handling knowledge.
3. High cost and non availability of some drugs and vaccines
4. Insecurity of most fish farms from predators.
5. High cost of quality nutrient rich feeds that could prevent nutritional diseases occurrence.

5.6 **Fisheries Input Situation**

Only three states had some records of fisheries input situation (Table 12c). Generally all the inputs (fingerlings, nets and kilns) were inadequate and unaffordable in Yobe, Plateau and Imo States. The major problem of fisheries inputs were high cost and scarcity, especially feeds for aquaculture.

6.0 AGRICULTURAL MECHANIZATION AND GRAIN STORAGE

6.1 AVAILABILITY OF TRACTORS

The data on availability and usage of tractors obtained was scanty. Twenty-four states responded to the questions on tractorization and only six states gave data on both government and private ownership of tractors. The data obtained from some ADPs and Tractor Hiring Units (THUs) under the supervision of the State's

Ministry of Agriculture and Rural Development are presented in Table 13. The common brands of tractors remain Massey-Ferguson, Ford, while Steyr-Ursus seems to be the commonest brand reported. New tractor brands mainly imported from Asian

countries include Kubota, Mahindra and Dong Chang. Most (over 95 per cent) of tractors reported are within the 45-90 horse power range. The data reveals that there were a total of 1554 tractors owned by the state governments and 792 owned by private individuals and organizations. Of the total number owned by governments, 59.4% were functional while 40.56% were non-functional. For the privately owned tractors, about 89% are functional while about 10.81% are non-functional. From the data, it could be concluded that the higher percentage of functional tractors among the private could be as a result of better maintenance than the government owned ones.

The highest number of functional tractors among the state governments was reported by Jigawa State which had 315 functional tractors out of a total number of 420 translating to about 75%. On the other hand, Abia State reported the least number of functional tractors with only 2 functional tractors. For private ownership, Kebbi State reported the highest number of functional tractors with 525 numbers reported. The least number of functional privately owned tractors was reported by Taraba State.

Generally, the number of functional tractors owned by both government and private sector are inadequate as large population of farmers across the states have no access to tractor services.

These services were reported to be untimely when land preparation operations are critical. This is more acute in states where animal traction is not common thereby causing manual labour to be very expensive.

Table 14 presents total land area prepared by tractors and the number of farmers served in the states that provided data. Only fourteen states provided data on this subject. From the report, Jigawa State had the largest number of land area prepared by tractors (634,000ha) which is 16.12% higher than the hectareage prepared in 2005. Furthermore, the least reported area prepared by tractors is from Lagos State, which reported only 2.5ha of prepared land area. The highest decline in area reported was in Lagos State, which recorded a decline of 85.1% of land prepared in 2005. The total number of farmers served witnessed a decline when compared with 2005. Yobe State recorded the highest decline (-62.5%). Tractor hiring rates are presented in Table 15. Private sector rates are about 20-30% higher than government rates. The highest increase on year rate differential was recorded by Katsina State where there was a 42.85% increase in rates charged in 2005. Nassarawa State reported the highest decline in rates charged (-40%) compared with 2005. Generally, the rates of the private sector operators were higher than that of government agencies, although the private operators were more reliable. Farmers generally preferred the services of the private operators if they can afford the rates. Most of the reported tractor service rates for government owned tractors do not include the cost of diesel and other sundry charges. While the charges for private operators are a lump sum that cover everything.

6.2 ANIMAL TRACTION SERVICES

Animal traction services are commonly practiced in the Sahel and Savannah ecological zones of Nigeria. Thirteen states reported on animal traction services. The rates charged for animal traction services are far lower than those charged for tractor services. This is the main reason why more farmers are clamouring for animal traction services. The rates charged for animal traction remained the same when compared with 2005 except in some few states. The highest rate change, an increase of 33% was reported by Borno State for rates charged on per day basis. Nassarawa State reported a decline (-8.3%) for rates of animal traction charged on per hectare basis.

6.3 GRAIN STORAGE

Only six states provided data on the capacity and condition of grain storage facilities in the states. All the states did not report on the quantity of produce stored in year 2005 and 2006. Two states (Taraba and Nassarawa) reported that their grain storage facilities were bad.

7.0: ASSESSMENT OF CONTRIBUTIONS OF NATIONAL SPECIAL PROGRAMME FOR FOOD SECURITY

The National Special Programme for Food Security (NSPFS) in Nigeria is a Federal Government of Nigeria initiative jointly implemented by the Food and Agriculture Organisation of the United Nations (FAO/UN). The first phase was solely funded by the FGN was expected to terminate by December 2005, but was extended to December, 2006 essentially to complete outstanding activities. Also being implemented within the framework of the SPFS is the South South cooperation (SSC), under which over 400 Chinese experts and technician are on ground in all the states and FCT to supplement SPFS activities.

The major project of the SPFS is the food security, whose components include; water management, crop intensification, farm diversification. Other projects include Agricultural Services and Constraints, Aquaculture and Inland Fisheries, Animal Diseases and Trans boundary Pest control, Marketing of Agricultural Commodities and Food Stock Management, and Soil Fertility Initiative.

Generally, commendable achievements were recorded during the year, even though many of the activities undertaken were carried over from the previous year.

7.1 Crop Intensification

7.11 Crop Production

The crop intensification component promoted the introduction of high-yielding and disease resistant crop varieties, enhanced extension delivery and input supply. During the season, a total of 3,231.99 hectares of assorted crops were cultivated by over 4,206 beneficiaries, comprising 1,265.1 hectares of roots and tubers, 1,386.71 ha of cereals, 441.5 ha of legumes and 138.68 ha (of assorted vegetables (4.29%). Considerable improvement were recorded in production and productivity as opposed to the non SPFS farmers. About 16.46 mt/ha was obtained for cassava, 1.73 mt/ha for maize, and an average of 4.21mt/ha for leafy vegetables (Details are presented on Table 17a).

7.12 Agro-processing

The agro-processing component focused on increased income through enhanced value addition. A total of 39 assorted agro-processing equipment were distributed to over 213 beneficiaries. Products included rice, cassava, yam, and oil palms and fish (see Table 17c for details).

7.13 Group Development

To enhance implementation activities and ensure sustainability, the group approach to module implementation was emphasized. A total of 1,563 groups were

on board, out of which, 1,390 numbers were registered (88.93%). Over 524 have also been trained since project inception. Generally, group cohesion was strong, while dynamics have been high, (Details are presented on Table 17d).

7.2 Farm Diversification (Livestock and Fisheries)

The farm diversification component promoted the implementation of such modules like livestock fattening, upgrading, poultry production and livestock integration. Diversification into fisheries also emphasized aquaculture and artisanal fisheries development. To this end, 25,729 livestock were fattened, 2,744 upgraded, while about 2,846 layers and 999,180 eggs were produced (Table 17b). On fisheries, over 80.49mt of assorted fishes were obtained from aquaculture and artisanal intervention. In all, over 1,297 farmers benefited from farm diversification activities during the year. Implementation activities are also on-going under Agro forestry, Health & Nutrition, et cetera.

7.3 South South Cooperation

The SSC is an initiative within the frame work of SPFS. It aims to enhance cost effective and adaptable technologies on water control, crop intensification, livestock production among others to beneficiaries. During the year under review, over 31 assorted micro-projects were established, with over 1,042 beneficiaries covering bio- gas technology, artificial insemination, water control and management.

The impact of NSFS in the socio-economic lives of the beneficiaries include:

- Improvement in standard of living of the participating farmers through enhanced income.
- Considerable improvement in production and yields per unit of measure as opposed to the non SPFS intervention
- Enhanced participation by beneficiaries attributed to the bottom-up approach of program implementation.
- Embracement of democratic values through selection/election of their representatives and setting up of requisite institutions.

7.4 Preparatory Activities for Expansion phase.

Following the impending termination of the pilot phase and in view of the need to enhance the multiplier effect of the programme to many other communities, preparatory activities have commenced with Donors' Consultative meetings held to obtain external financial commitments. Also, national sensitization workshop have been held for requisite stakeholders at the national level to create awareness on the objective, concepts, principles and implementation arrangements.

- Increase in outreach as a result of which additional sites have been funded by the States Government in Kano, Oyo, Ondo and Akwa-Ibom states.

8.0 COMMODITY PRICES

The prices of agricultural commodities fluctuate, depending on temporal and spatial factors, market forces and as a result of social consideration.

Generally, the prices of cassava (garri), a major staple in the country was on the decline in producing zones like South East, Middle and South West. In Ebonyi for instance, a decrease of about 47.1% was observed, considering a price drop from ₦125/kg to ₦85.0/kg within the season (Table 18). Price drop of about 27.64% and 26.19% were also obtained in Benue and Kogi States. This trend may not be unconnected to the effect of the Presidential Initiative on Cassava, under which enormous production was recorded.

Similarly, price decrease was observed for rice with Niger State recording a price drop of about 37.28% from ₦133.23/kg in January to ₦83.55/kg in August.

For cereals, States such as Nasarawa, Benue, Plateau and Niger witnessed declining price regime, with a price drop from ₦76.15/kg to ₦55.63/kg observed in Benue. Decreases were also observed in the North West States of Jigawa, Kaduna and Yobe; particularly maize. The trend is obviously due to the favourable rainfall distribution and use of improved productivity enhancing inputs, especially fertilizers and improved maize seeds.

However, the trend of urban prices of cowpea was fairly stable, but vary in parts of North West and North East with prices hanging from ₦44/kg in Zamfara to ₦105/kg in Kaduna State. The trend was mixed in other parts of the country, with price increases of about 36.4% obtained in the FCT from ₦80.62/kg at start of the season to ₦110.0/kg by August. Decreases in price of about 16.7% was witnessed in Ekiti State

The general price trend under livestock, especially poultry was without discernible pattern. Cases of price drop were observed in some states and this was attributable to the bird flu incidence. For instance, decreases of about 50.58% and 43.84% were observed in Kogi and Delta States within the season.

Spatial effect on prices within the season was also significant. The price of gari fluctuated from ₦45.45/kg in Oyo to ₦100/kg in Adamawa. Maize also witnessed same price trend from about ₦27.79/kg in Kano to about ₦105.0/kg in Akwa-Ibom. Prices of beef also varied from ₦210.85/kg obtainable in Kaduna in January to ₦622.5/kg in Bayelsa State.

9.0 COST OF PRODUCTION

The mean cost of production of major commodities are presented in Table 19. The data show that across the states, there were marginal increases in cost of production of the major agricultural commodities with exceptions in Zamfara, Nasarawa, Yobe and Adamawa states where cost of production substantially increased in 2006 compared to 2005. In Zamfara state for example, cost of production generally increased by 40 – 80%. These general increases are attributable to increased demand for labour.. In Narasarawa state, the cost of production of maize and Groundnut increased by 62.8% and 30.35% respectively. In Yobe state, the cost of production of maize, sorghum and rice increased by 32.4%, 24.2% and 18.9% respectively. The cost of beniseed production increased by 40.0%.

However, despite these increases in some states, marginal or no reduction in production cost was observed for some commodities in few states. These commodities include sorghum, maize, millet, rice, cowpea, groundnut, yam, cassava and soybean.

Labour rates for various farm operations are presented in Table 20. The data show that many states recorded slight increases in the labour. Jigawa, Kaduna, Bauchi, Yobe and FCT recorded increases of between 6.7% to 66.7% for most of the major commodities planted in 2006.

10.0 **ADP EXTENSION ACTIVITIES AND PERFORMANCE**

10.1 **Technologies being evaluated through OFAR, SPAT and MTPs**

The technologies being evaluated through OFAR, SPAT and MTPs are presented in Table 21. The ADPs were able to carry out these activities despite the funding constraint they have. Other problems militating against the conduct of these extension activities include high cost of inputs, logistic problems, lack/poor supervision, poor staffing and low morale of extension agents due to non payment of salaries and allowances. Also, untimely release of materials and late conduct of in-house review meetings and OFAR workshop by the coordinating Research Institutes.

Table 21: TECHNOLOGIES EVALUATED UNDER OFAR, SPAT AND MTPs

STATE	CROP/LIVESTOCK	OFAR		SPAT		MTPs
Ondo	Sweet potato	-Determination of application time of sweet potato introduction QS	Maize	-Optimum plant population in sole maize	Maize	-Optimum plant population maize sole
	Maize/Cassava	-Erosion control in maize/Cassava S/P intercrop	Cassava	-Optimum plant population in cassava sole	Cassava	-Optimum plant population cassava sole
	Soyabean	-Evaluation of performance of paw-paw under two spacing options in paw paw/maize/cassava intercrop	Maize	-Planting of SUWAN-ISR and Oloyin maize varieties in Fadama	“	-Introduction of improved varieties TMS 92/0326 TME 419
			Maize	-Planting of TDR02565 or TDR 02665 hybrid corn	Yam	-Seed yam production by minisett.
	Cocoyam	-Determination of optimum rate of organic manure for cocoyam production	Pineapple	-Rapid multiplication of pineapple suckers	Yam	-More yam production through seed yam
			Livestock	-Control of in breeding problems in small stock animals.	Sweet potato	-Introduction of improved variety TIS 8164 and TIS 86/0356 sweet potato
			Fish	-Establishment of homestead fish ponds	Cocoyam	optimum plant population
			Orchards Citrus	-Termite control in orchards and control of fruit piercing moths	Rice	-NERICA rice total package
			Vegetables	-Optimum plant population of leafy and fruit vegetables in Fadama		
			Crop	- Yam/maize/cassava/vegetable intercrop	Cassava	-Cassava production intensification
			Yam	-Seed yam production by minisett technique	Livestock	-Partial substitution of maize with cassava in poultry feed production
			Rice	-Upland rice production		
			Rice	-Swamp rice production		

Table 21: Cont'd.

10.2 FARM BROADCAST

The use of radio and television programme is a very important source of getting information across to farmers. Some of these radio and television programmes are produced in English, while others are produced in Hausa, or other local Nigerian languages and aired in state radio and television stations. Farm broadcast programme being aired in Nigerian languages are more comprehensible

by farmers and other listeners. Among the major problems reported to be affecting farm broadcast in the states are lack of funds, lack of editing machine, no functional vehicles to carry out the field work, high charges for airing radio and television programmes; poor electricity supply, insufficient trained personnel to repair broken down equipment, etc.

10.3 PROBLEMS ASSOCIATED WITH ADP EXTENSION ACTIVITIES

The most common problem prevailing throughout the ADPs is the poor funding situation. Fund allocation from the states and the Federal government are grossly inadequate and often disbursed lately. This in addition to other factors has led to the ADPs inability to meet their required logistic man-power development and other needs. This has resulted in the wide-spread problem of low EA: farmer ratio, poor mobility, poor communication facilities and several other problems in the ADPs across the states. A summary of the problems is presented in Table 22.

Table 22: Problems of Extension Services

S/No.	Problems	Frequency Counts
1.	Poor funding of the ADP	34
2.	Inadequate qualified extension staff	26
3.	Lack/inadequate serviceable vehicles	24
4.	Lack of staff training	19
5.	Inadequate logistic support	5
6.	Non-payment or delayed payment of staff allowances	2
7.	Non availability of reliable seed/companies	4
8.	High cost of inputs	2
9.	Unstable pricing system to the disadvantage of farmers	5
10.	Non-participation of LGAs in funding and implementation of extension and rural development programs at local level	1
11.	Role conflict due to ADP staff involved in other state extension activities	1

10.4 PROBLEMS NEEDING RESEARCH

A very common problem the ADPs want to be researched into, is an alternative extension approach to the T&V extension system currently being implemented by the ADPs across the states. This is in realization of the fact that the T&V is very

expensive and therefore unsustainable. The ADPs will want an extension system that is cost-effective and sustainable for implementation at the states level.

Another problem which is very common is the need for alternative low-cost feeding for livestock, poultry and fisheries. This is more pronounced in the Northern states where dry season feeding for livestock is a very serious problem. Some ADPs would want low-cost aquaculture technologies developed for them. This is because the current aquaculture technologies are expensive and beyond the reach of the ordinary small-scale farmer.

Treatment of livestock using herbs (IKS) is another area that needs to be researched into. This is in view of the fact that livestock drugs are very scarce, and where you get them they are very expensive. There is also the problem of adulteration of drugs being sold to livestock farmers.

There is also the need to intensify research on sorghum (stalls/yield ratio). This is because both the stalls and the grains are very important to the farmer.

Research into the causes of fruit abortion in citrus and mango is needed, by most of the ADPs. Also machinery for cassava peeling, ginger splitting and scrapping are also needed in the states where these crops are produced in large quantities.

Table 23: Training Needs of ADPs

S/No.	Training Topic/Subject	No. of ADPs

25.	Management and information system	1

10.5: Agricultural Shows and Field Day

Among the important extension activities that encourage farmers to increase their efficiency are agricultural shows and field days. During Agricultural shows, farmers bring their produce for display and at the same time get exposed to the use of better improved and more efficient farm practices. They also learn improved and efficient farm agricultural practices at field days. Table 24 presents the conduct of field days and agricultural shows in the states. As seen in the table, some ADPs recorded a modest achievement in the execution of field days, while agricultural shows were poorly executed across the states. Of the 36 states including FCT, only 6(16.6%) of the states conducted agricultural shows, with Anambra, Abia and Ebonyi recording 2 each. Twenty one (21) ADPs representing 58.3% conducted field days. Enugu, Yobe, Ebonyi, Imo, Anambra and Abia states conducted both agricultural shows and field days although the number varies from one state to the other. The major problem affecting the conduct of agricultural shows and field days, include: inadequate or non provision of funds, inadequate provision of demonstration materials etc.

Table 24: Conduct of Agricultural shows and field day

11.0: Involvement of Non-Government Organization (NGOs) and Private Agencies in Extension

The involvement of NGOs and private agencies in agricultural extension is presented in Table 25. As seen in the table, 42 NGOs and private organization were reported to be involved in agricultural extension and other related services to farmers in the various states. Some of there activities include: Agro-processing, training, credit administration, utilization of produce, crop and livestock production, environmental management, water

supply etc, which sometimes cover more than one state. Majority of the NGOs and private agencies reported that they interact with state ADPs frequently and participate in some of their activities like field days, pre-season trainings; workshops, etc. Some of the prominent NGOs/private agencies include SG-2000, ECWA and FADU.

Table 25: NGOs and Private Agencies Involved in Agricultural Extension

S/No.	Name of Organization	Address	Type of Activities	States
1.	Sasakawa Global 2000 (SG 2000)	KNARDA Office, Kano	Agricultural Extension	Katsina, Yobe, Kano, Zamfara, Bauchi
2.	ECWA	Wukari road, Borno	Utilization of produce	Borno, Jigawa, FCT.
3.	PROSAB	Kwajafa road, GRA	Crop and Livestock production	Borno
4.	Agro-Alailde	BOSAP	Agricultural Extension	Borno
5.	PROSAB	BOSAP, Maiduguri	Crop and livestock production	Yobe

41.	Shell Petroleum Development Company	Port Harcourt	Agricultural Extension	Rivers
42.	Elf Nigeria Limited	Port Harcourt	Agricultural Extension	Rivers.

12.0 CONCLUSION AND RECOMMENDATIONS

Rainfall was erratic in most of the Northern states at the beginning of the cropping season and that affected crops like sorghum, millet and groundnut. By May to June, rainfall had established and full scale farming activities commenced. In terms of quantity and distribution the rains were considered good for cropping activities throughout the nation.

The cropping patterns remain the same as that of previous years. Mixed and strip cropping with cereal and legumes were the common practices across the country. In addition it was observed in most of the state that there were new openings of vast land in support of various government interventions to promote certain crops such as rice, maize and cassava. Except for dry spell experienced in some states like Kebbi, Kano, Gombe, Borno and Katsina at the beginning of the season that led to multiple planting the crop production this year was favourable. Incidences of insect pest and diseases outbreak were not severe where they occurred. Although there were fears of re-occurrence of quella birds in Kebbi, Sokoto, Katsina , Borno, Kwara and Cross River states if control measure were not put in place. All these put together give room for expectation of good harvest for most of the crops across the country.

The area devoted to sorghum increased by 2.5% while the output has increased by 4.91% over the previous year. Maize hectarage increased by 4.8% while the output increased by 8.42% over that of 2005. Similarly rice increased in hectarage by 5.76% while the output also increased by 14.4% that of 2005. There was an increase of 5.18% in the land devoted to millet and output of 7.01% over that of 2005. Groundnut production increased in hectarage by 1.91% and output by 4.49% over that of 2005. Total land devoted to cowpea increased by 4.19% while the output increased by 3.61% over that of 2005. The total land area devoted to cassava increased by 17.21% while the output was 25.4% higher than that of previous year. However, there was a decrease in the land area devoted to yam by 2.16% But this did not affect the output which increased by 9.8% compared with 2005 output which is an indication that the weather was favourable for yam production in 2006.

Livestock production situation in the country shows slight increase in 2006 over 2005. However, most states lacked credible records. The problem of diseases and pest attack still persist in most states on large ruminants, poultry and swine, thus causing substantial economic losses. Livestock input procurement and distribution are not a priority of most states, and this situation jeopardize government attempts to improve the productivity of livestock. Records of fisheries production situation, incidences of pests and diseases and input procurement and distribution are not kept by most states. This has been the trend over the years.

There were generally marginal increases in cost of production of the major agricultural commodities with the exceptions in Zamfara, Nasarawa, Yobe and Adamawa states where cost of production substantially

increased by 40 – 80.7%. However, despite the increases, marginal or no reduction on production cost was observed for some commodities in few states.

The situation of agricultural mechanization reveals that many states did not operate tractor hiring services and where available were not sufficient. Animal traction where practiced helped to reduce the cost of land preparation. The high cost of investment in owning a tractor as well as cost of tractor hiring services for tillage operation constitute serious problem for farmers. Grain storage facilities are in poor shape in many states of federation thus, exposing the country to risk of food shortage. Generally the prices of commodities declined in August 2006 as compared with the same period in 2005 with the exception of cowpea for which the price was fairly stable but vary in part of North west and North East. The general trend for livestock especially poultry was without a desirable pattern, however cases of price drop was observed in some states attributable to the speculative issue of bird flu.

The ADPs and/or state government input supply companies were involved in procurement and distribution of improved farming inputs. Government subsidy on fertilizer was maintained during the season. Fertilizers were readily available in the open market but the prices were prohibitive. The unit price of government supplied NPK ranged from N1000 in Kano state to N2,450 in Delta state while Urea price ranged from N1000 in Kano state to N2,950 in Delta state. The open market prices were higher ranging from N2,500 to N4,000 depending on the state and brand of fertilizer. Distribution system of government fertilizers varied across states. In some states fertilizer distribution was centrally done the State Ministry Of Agriculture, while some states had committees at various levels. However, farmers showed that these channels of distribution were inadequate and resulted to untimely and inadequate supply of the commodity. There were also reports of poor quality of fertilizer in some states. High cost and adulterated agro-chemicals were also reported. As in previous years the ADP, were unable to carryout their activities satisfactorily due to inadequate and untimely disbursement of funds

RECOMMENDATIONS

1. There is need for ADPs to have the facilities for relevant data collection. This refers not only to rainfall data collection but on all agricultural production data including livestock. This is necessary to enhance adequate planning for agriculture and rural development.
2. The Federal, States and LGAs should have a working arrangement to increase the number of tractors to better the deplorable tractor hiring situation in some of the states. This will make tractor hiring available to farmers at affordable rate. In the alternative, government should encourage the formation of viable farmers groups who will have the purchasing power to own tractors at subsidized rates.
3. The states, federal and state government should set up control and standardizing unit for fertilizers and other agro-chemical under the Ministry of Agriculture or ADPs. This will check the issue of sub-standard and adulterated chemicals.
4. The available government storage facilities across the states should be renovated to mop up excess produce expected this year. This will prevent glut and at the same time enhance price stability to the advantage of the farmers, which will in turn encourage farmers to stay in farming business
5. The agency responsible for extension in the state which is the ADP should be at the centre of fertilizer distribution in the states.

6. Funds should be made available and timely for ADPs to carryout their extension actions. ADPs should also exploit the possibilities of executing joint agricultural extension activities with LGAs for the benefit of the farmers.
7. As a long term solution to the funding of agricultural extension, the three tiers of government should contribute a certain amount of funds for the extension purpose.
